

Habitats

Plants and animals live together in **habitats**. A habitat is the natural home or environment of an organism.

A habitat includes everything that a living thing needs to survive.

Plants and animals living together in different habitats form an **ecosystem**.

Keys are based on observable features and are used to help us identify organisms or place them into the correct group.

Every key starts with a question to which the answer is either 'yes' or 'no.' Based on the answer to each question, the key leads us to a group to which the organism belongs.
