

Pollution

Resources are things we get from the environment, like water, timber and metal.

There is only a limited amount of certain resources. If we use up all of that resource, there will not be any left.

One way to make resources last longer is to use them carefully and to recycle products when we are finished with them.

Pollution

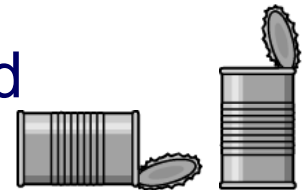

There are many ways to **recycle**.

Compost – Organic waste is put onto a compost heap to decay. Compost can be used to help plants grow.

Pulp – Paper can be crushed into a soft, wet pulp. Pulp can be used to make more paper.

Melt down – Metal, glass and plastic can be melted down so that the material can be used again.

Items that can't be recycled are sent to a **landfill**.
Trash is buried in the ground and covered with dirt.

So **79** of the **85** items could have been recycled!
