

Arithmetic sequences

x	-2	-1	0	1	2	3	4
y	5	0	-3	-4	-3	0	5

$$x^2 - 2x - 3 = 0$$

$$(x+1)(x-3) = 0$$

$$x = -1 \text{ or } x = 3$$

The **Standards for Mathematical Practice** outlined in the Common Core State Standards for Mathematics describe varieties of expertise that mathematics educators at all levels should seek to develop in their students.

They are:

- 1) **Make sense of problems and persevere in solving them.**
- 2) **Reason abstractly and quantitatively.**
- 3) **Construct viable arguments and critique the reasoning of others.**
- 4) **Model with mathematics.**
- 5) **Use appropriate tools strategically.**
- 6) **Attend to precision.**
- 7) **Look for and make use of structure.**
- 8) **Look for and express regularity in repeated reasoning.**

What do these sequences have in common?

3, 6, 9, 12, 15 ...

add 3

5, 7, 9, 11, 13 ...

add 2

2, 7, 12, 17, 22...

add 5

8, 11, 14, 17, 20, ...

add 3

100, 104, 108, 112, 116...

add 4

All these sequences are made by **adding** on the same number each time. They are **arithmetic sequences**.

The difference between any two consecutive terms in an arithmetic sequence is called the **common difference**, d .

Each term in a sequence is identified by its position in the sequence.

The first term is a_1 , because it is in position 1.

The term in position n , where n is a natural number, is called a_n .

An arithmetic sequence can be defined **recursively** by the formula:

$$a_{n+1} = a_n + d$$

The value of the first term needs to be given as well, so that the definition is unique.

How do you find the **general term** of an arithmetic sequence?

$$8, 11, 14, 17, 20\dots$$

$+ 3 \quad + 3 \quad + 3 \quad + 3$

This is an arithmetic sequence with 3 as the common difference. We could write this sequence as:

$$8, 8 + 3, 8 + 3 + 3, 8 + 3 + 3 + 3, \dots, 8 + \underbrace{3 + \dots + 3}_{n-1 \text{ times}}, \dots$$

or

$$8, 8 + 3, 8 + (2 \times 3), 8 + (3 \times 3), \dots, 8 + ((n - 1) \times 3), \dots$$

The general term of this sequence is $8 + 3(n - 1)$

Arithmetic sequence and linear functions

An arithmetic sequence is a linear function on the natural numbers.

Press "**play**" to see how this can help to find an explicit formula for the general term of a sequence.

Investigating arithmetic sequences

$n = 0$ $n = 1$ $n = 2$ $n = 3$ $n = 4$ $n = 5$ $n = 6$ $n = 7$ $n = 8$ $n = 9$

If we call the first term of an arithmetic sequence a_1 and the common difference d we can write a general arithmetic sequence as:

$$\begin{array}{ccccccccc} 1^{\text{st}} & & 2^{\text{nd}} & & 3^{\text{rd}} & & 4^{\text{th}} & & 5^{\text{th}} & & \\ a_1, & a_1 + d, & a_1 + 2d, & a_1 + 3d, & a_1 + 4d, & \dots & & & & & \\ \underbrace{\hspace{1.5cm}}_{+d} & \underbrace{\hspace{1.5cm}}_{+d} & \underbrace{\hspace{1.5cm}}_{+d} & \underbrace{\hspace{1.5cm}}_{+d} & & & & & & & \end{array}$$

The **explicit formula** for an arithmetic sequence with common difference d is given by

$$a_n = a_1 + (n - 1)d$$

We can derive the **general form** of the explicit formula for an arithmetic sequence with common difference d from the equation of a line.

The point–slope form of the equation of a line is:

$$y - y_1 = m(x - x_1)$$

Write n for x , a_n for y , and d for m :

$$a_n - y_1 = d(n - x_1)$$

Use the first term in the sequence, so $x_1 = 1$ and $y_1 = a_1$:

$$a_n - a_1 = d(n - 1)$$

Rearrange to isolate a_n :

$$a_n = a_1 + d(n - 1)$$

Finding the n^{th} term in arithmetic sequences

Question 1/5: What is the n^{th} term of the arithmetic sequence 7, 9, 11, 13, 15, ...?

Press the "=" button to show the calculations step by step.

$$a_n = 2n$$

$$a_n = 2n + 7$$

$$a_n = 2n + 5$$

$$a_n = 5n + 2$$

A sequence can be represented by its first terms, a recursive definition, an explicit formula, or a graph of the terms. Can you recognize when these represent the same sequence?
Select the sequence that does not match the others.

Press **start** to begin.

start

The cost of hiring a car from Carrie's Cars depends on the number of days the car is needed for:

Days	1	2	3	4	5
Cost	\$60	\$80	\$100	\$120	\$140

Find the explicit formula and use it to solve these problems:

- 1) What is the cost for 6 days?
- 2) How much will it cost for 2 weeks car hire?
- 3) How many days can Lois hire a car for if she has \$250?

The car hire cost is an arithmetic sequence with common difference 20.

60, 80, 100, 120, 140, ...

Find the explicit formula first:

$$a_n = a + (n - 1)d = 60 + (n - 1)20 = \mathbf{40 + 20n}$$

1) The cost for 6 days is the 6th term:

$$140 + 20 = \mathbf{\$160}.$$

2) For 2 weeks, $n = 14$ so it will cost **\$320**.

3) Lois has \$250, so solve $250 = 40 + 20n$ to get $n = 10.5$.

Lois can only hire the car for full days so n must be an integer less than 10.5. She can hire the car for **10 days**.

A group of 34 school students go on a trip to the theater, accompanied by 2 teachers. There are 8 seats in the front row of the theater, and every row behind that has 2 extra seats. The school group take up 3 consecutive rows.

Which rows are they sitting in?
